1 Actors

Actor Title	Description
Scanner	This role is performed at the Medical Facility, possibly by an unskilled (“entry level”) worker.
Administrator	?Who does this role work for? ?What skill level/skills are required?
Coder	This role is performed by a remote worker, likely a home worker, through their home broadband connection with a PC and web interface.
Auditor	??Is this role filled by an effectively, more senior and more trusted Coder??
Data Entry	This role is performed at the Medical Facility.
Hospital Administrator	This role is performed at the Medical Facility.

NewCo-Med – Use Cases

2 Use Cases

2.1 System Context Use Case

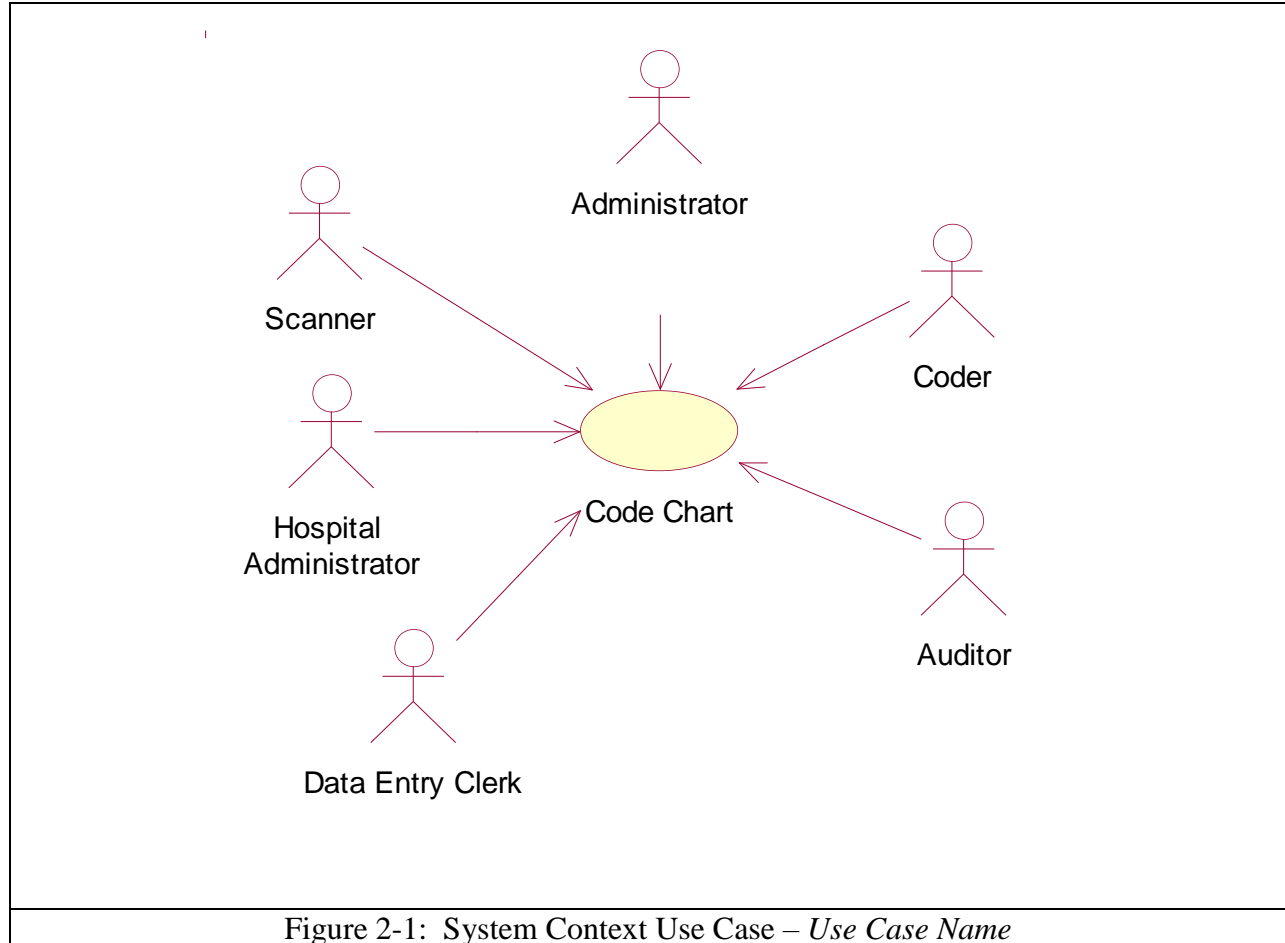

Figure 2-1: System Context Use Case – *Use Case Name*

Use Case Name:	Code Chart – System Context
Iteration:	Façade
Summary:	A Medical Chart from a Medical Facility is entered into the system and subsequently coded. The encoded information then becomes available to the Medical Facility in a Summary . Additionally the Medical Facility can generate Reports which can contain a consolidation of Summaries .
Basic Course of Events:	<ol style="list-style-type: none">1. The <i>Scanner</i> electronically scans the Medical Chart.2. The <i>Coder</i> codes the Medical Chart, creating the Summary.3. The <i>Hospital Administrator</i> views the Summary containing the encoded data from the Medical Chart.

NewCo-Med – Use Cases

2.3 Use Case Catalog

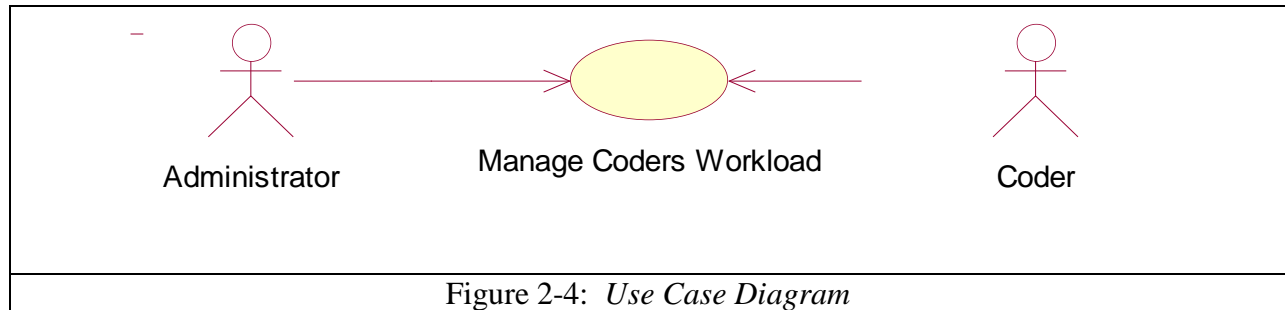

2.3.1 Scan Chart

Use Case Name:	Scan Chart
Iteration:	Façade
Summary:	The <i>Scanner</i> selects the Patient Information and then scans in the paper copy of the Medical Chart for that patient.
Basic Course of Events:	<ol style="list-style-type: none">1. Select or enter the Patient Information for the chart to be scanned.2. Scan the chart.
Alternative Paths:	<ol style="list-style-type: none">1. The <i>Coder</i> marks a Medical Chart as “pending” and it is returned to the <i>Scanner</i>.2. The <i>Scanner</i> scans in the additional chart pages.
Exception Paths:	If the Medical Facility does not provide Patient Information electronically then the <i>Scanner</i> will manually <u>enter</u> the patient information.

NewCo-Med – Use Cases

2.3.3 Code Chart

Use Case Name:	Code Chart
Iteration:	Façade
Summary:	The <i>Coder</i> receives a Patient Information and a single Medical Chart as a scanned image and medically codes the chart. The result of the coding is the Summary Record .
Basic Course of Events:	
Alternative Paths:	If a Medical Chart is incomplete, the <i>Coder</i> can mark the chart as “pending” which will alert the <i>Scanner</i> that more information is needed.
Exception Paths:	
Trigger:	
Assumptions:

3 Domain Objects

The following is a catalog of domain objects. This really belongs in another document, but I'm going to keep it here for now. Domain Objects should be identified in the Use Case descriptions as capitalized and bolded terms.

- Patient Information Record
- Medical Chart (Encounter) Record
- Summary Record
- Audit Trail Record
- Report
- Chart Assignment
